

WIND SHADER

OVERVIEW

The Wind Shader is a simple URP shadergraph included with some of my vegetation asset packs. I wouldn't recommend in a production environment due to its limitations and simpleness, but it is there to give you a head start in keeping the scene looking alive.

SUMMARY

Wind

- WindSpeed: The speed the noise texture is scrolled by
 - WindStrength: A multiplier that determines how far vertices are displaced
 - WindDensity: The scale of the noise texture
 - WindDirection: A vector3 multiplier that affects the X and Z directions
 - MaskRange: Used in vertex colour mask, how far away from the original colour is accepted
 - MaskFuzz: Similar to MaskRange, kind of blurs the lines between wind-affected vertices and non.
 - VertexColorMask: Which vertex colour you want to be affected by wind.
-
- Albedo: albedo, regular texture
 - MetalSmoothness: Smoothness comes from alpha channel, metallic comes from everything else in the material
-
- AlphaClipThreshold: How much alpha to keep/cutoff
 - Normal: A normal map
 - NormalStrength: Normal multiplier
